Dear Dr. Ganguly,

As part of the ERPR recall, Don Cook has sent me a list of patients for me to follow up based on results of the Mount Sinai retesting.

1. [REDACTED] - this lady was sent originally in 2000 (SU-7560-00). This was her left breast biopsy. We reported ER 10% and PR 10%. Retest showed only DCIS, therefore there is no repeat. Our H&E slides show focal infiltration, probably not seen on repeat in Toronto, however she had mastectomy which showed ductal carcinoma remote from the original. (Reports are enclosed). I will get ERPR and Her2neu done on this tissue.
2. [REDACTED] - SU-7979-03. Mount Sinai reported no tumor on repeat testing. We reported poor quality sections and staining preclude assessment. Stain is non contributory. Mastectomy was done and we reported ER positive (10-20% of the tumor cells are positive). I have sent the reports to you for opinion as to need for retesting, since she was reported as positive and should have been treated.
3. [REDACTED] - we reported ER negative on block XX, but repeat on same block in Mount Sinai showed no tumor. There is tumor on the original H&E. The block has not been returned so I can't repeat to seen if there is still residual. I note however there was only a single focus and the mastectomy was negative. There likely is no more tumor left. Please advise.

If there are any other patients from Corner Brook needing retesting, please let me know. I look forward to your reply.

Sincerely,

---
