

Spoke to Joy McCauley April 10, 2006

Attempted a meta analysis ~~not~~ when standard  
practice amongst oncologists is to Rx with  
tamoxifen if ER/PR  $\geq 1\%$ . This goes  
against NCIC guideline where 10% is  
the cut off point. Many labs are just  
~~It is~~ reporting as positive or negative  
if this is the case. ~~as~~ we may have to  
change our report: as + or -ve, ~~and~~ and  
not give %. We will discuss further.

Joy claims that oncologists have no real  
good evidence to show why they are using  $\geq 1\%$
